

UPDATE: Precautions to take - Water quality for lakes Bibite and Tremblant

(Lac-Tremblant-Nord, September 15, 2023) - Following the discovery of the possible presence of cyanobacteria in lakes Bibite and Tremblant last week, it was reported to the Ministry of the Environment, and we are still awaiting the results.

We invite you to be as cautious as possible in this type of situation. It is important to follow the recommendations and precautions indicated by the Ministry, in particular :

- **Not to drink the water from the lake**
- **Not to swim**
- **Not to use the water directly from the lake for preparing meals or giving it to animals**

It is important to remain vigilant at all times and observe the water before using it for any purpose, to see if any particles or abnormal odours are present.

Information resources

- To find out more about cyanobacteria (how to distinguish them, when they become a problem, what causes them, etc.): [Preventing the effects of cyanobacteria | Gouvernement du Québec](#)
- For more information on the subject: [Cyanobacteria | Gouvernement du Québec](#)

We will inform citizens when we have more information, as we're monitoring the situation closely.

We would also like to thank our citizens for their vigilance and cooperation in dealing with this unusual situation.

Thank you for your cooperation !
